Core java interview questions and answers for experienced professionals pdf

Continue

```
We have compiled the most frequently asked Java Programming interview Questions and Answers that will help you prepare for the Java viva questions, we have covered all commonly asked basic and Java interview questions for
experienced candidates with detailed answers to help you clear the job interview. The following list contains 100 important Java programmers to help them prepare for the interview questions and answers for experienced programming questions for freshers as well as Java questions will help you to crack
your Job interview easily. Core Java Interview Questions and Answers for Freshers and Experienced Q1. What is the difference between an Inner class and a Sub-Class? Ans: An Inner class is a class which is nested within another class and a Sub-Class? Ans: An Inner class has access rights for the class which is nesting it and it can access all variables and methods defined
in the outer class. A sub-class is a class which inherits from another class called super class. Sub-class can access specifiers for Java classes? Ans: In Java, access specifiers are the keywords used before a class name which defines the access scope. The types
of access specifiers for classes are: 1. Public: Class, Method, Field is accessed from the same package, but not from outside. 3. Default: Method, Field, class can be accessed only from the same package and not from the same package.
outside of it's native package. 4. Private: Method, Field can be accessed from the same class to which they belong. Q3. What's the purpose of Static method or a variable between multiple objects of a class instead of creating separate copies for each object, we use static
keyword to make a method or variable shared for all objects. Q4. What is data encapsulation and what's its significance? Ans: Encapsulation helps programmers to follow a modular approach for software development as each object has
its own set of methods and variables and serves its functions independent of other objects. Encapsulation also serves data hiding purpose. Q5. What is a singleton class? Give a practical example of its usage. A singleton class concept
is useful for the situations when there is a need to limit the number of objects for a class. The best example of singleton usage scenario is when there is a limit of having only one connection to a database due to some driver limitations or because of any licensing issues. Q6. What are Loops in Java? What are three types of loops? Ans: Looping is used in
programming to execute a statement or a block of statement repeatedly. There are three types of loops are used when number of times to execute the statements is known to programmer. 2) While Loops While loop is used when
certain statements need to be executed repeatedly until a condition is checked after execution of statements. 3) Do While Loops Do While Loop is same as While loop, statements are executed at
least once. Q7: What is an infinite loop? How infinite loop is declared? Ans: An infinite loop can be broken by defining any breaking logic in the body of the statement blocks. Infinite loop is declared as follows: for (;;) { // Statements to execute // Add any loop breaking logic } Q8. What is
the difference between continue and break statement? Ans: break and continue are two important keyword is used in Loops. When a break keyword is used in Loop is broken instantly while when counter reaches
4. for (counter = 0; counter & lt; 10; counter++) system.out.println(counter); if (counter = 4) { break; } } In the below example when counter reaches 4, loop jumps to next iteration and any statements after the continue keyword are skipped for current iteration. for (counter++) system.out.println(counter); if (counter = 4) { break; } }
4) { continue; } system.out.println("This will not get printed when counter is 4"); } Q9. What is the difference between double and float variables in Java? Ans: In java, float takes 4 bytes in memory while Double takes 8 bytes in memory while Double takes 8 bytes in memory.
What is Final Keyword in Java? Give an example. Ans: In java, a constant is declared using the keyword Final. Value can be assigned only once and after assignment, value of a constant is declared using the keyword Final int const val = 100 When a method is declared
as final, it can NOT be overridden by the subclasses. This method are faster than any other method, because they are resolved at complied time. When a class is declares as final, it cannot be subclassed. Example String, Integer and other wrapper classes. Q11. What is ternary operator? Give an example. Ans: Ternary operator, also called conditional
operator is used to decide which value to assign to a variable based on a Boolean value evaluation. It's denoted as? In the below example, if rank is 1, status is assigned a value of "Done" else "Pending"; public class conditionTest { public static void main(String args[]) { String status; int rank = 3; status = (rank == 1)? "Done" : "Pending";
System.out.println(status); } Q12: How can you generate random numbers in Java? Ans: Using Math.random() you can generate random numbers in the range greater than or equal to 0.1 and less than 1.0 Using Random class in package java.util Q13. What is default switch case? Give example. Ans: In a switch statement, default case is executed
when no other switch condition matches. Default case is an optional case is an optional case is used. public class switchExample { int score = 4; public static void main(String args[]) { switch (score) { case 1: system.out.println("Score is 1");
break; case 2: system.out.println("Score is 2"); break; default: system.out.println("Score is 2"
type. Q16. What are Java Packages? What's the significance of packages? Ans: In Java, packages helps developers to modularize the code and group the code for proper re-use. Once code has been packaged in Packages, it can be
imported in other classes and used. Q17. Can we declare a class as Abstract method, it must be declared as abstract the will give an abstract method. However, if a class has even one abstract method, it must be declared as abstract otherwise it will give an
error. Q18. What's the difference between an Abstract Class and Interface in Java? Ans: The primary difference between an abstract class and interface is that an interface is that an interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface is that an interface is that an interface is that an interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The primary difference between an abstract class and interface in Java? Ans: The p
with or without concrete implementation. Another key difference in the use of abstract class which implement all the methods of the interface while a class which implement all the methods of its super class. A class can implement
multiple interfaces but it can extend only one abstract classes? Ans: Interfaces over abstract classes? Ans: Interfaces over abstract classes as extra indirections are required for interfaces. Another key factor for developers to take into consideration is that any class can
extend only one abstract class while a class can implement many interfaces also puts an extra burden on the developers as any time an interface is implemented in a class; developer is forced to implement each and every method of interface is implemented in a class; developer is forced to implement each and every method of interfaces also puts an extra burden on the developers as any time an interface is implemented in a class; developer is forced to implement each and every method of interfaces. Use of interfaces also puts an extra burden on the developers as any time an interface is implemented in a class; developer is forced to implement each and every method of interfaces.
a package is imported, its sub-package aren't imported and developer needs to import them separately if required. For example, if a developer imports a package university.*, all classes from its sub-package (say department), developer
has to import it explicitly as follows: Import university.department.* Q21. Can we declare the main method of our class as private? Ans: In java, main method must be public static in order to run any application correctly. If main method is declared as private? Ans: In java, main method of our class as private? Ans: In java, main method must be public static in order to run any application correctly. If main method is declared as private? Ans: In java, main method must be public static in order to run any application correctly. If main method is declared as private? Ans: In java, main method must be public static in order to run any application correctly. If main method is declared as private? Ans: In java, main method must be public static in order to run any application correctly. If main method is declared as private? Ans: In java, main method must be public static in order to run any application correctly.
runtime error. Q22. How can we pass argument to a function by reference instead of pass by value? Ans: In java, we can pass argument to a function only by value and not by reference instead of pass by value? Ans: In java, we can pass argument to a function only by value and not by reference instead of pass by value? Ans: In java, we can pass argument to a function only by value and not by reference instead of pass by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value and not by reference instead of pass by value? Ans: In java, we can pass argument to a function only by value and not by reference instead of pass by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function only by value? Ans: In java, we can pass argument to a function on the function of the function of the function of the function of th
the class. All objects of a class implementing serialization? Ans: Serialization is used when data needs to be transmitted over the network. Using serialization, object's state is saved and converted into byte stream is transferred over
the network and the object is re-created at destination. Q25. Is it compulsory for a Try Block to be followed by a Catch Block or Finally block or both. Any exception thrown from try block needs to be either caught in the catch block or else any specific tasks to be
performed before code abortion are put in the Finally block. Q26. Is there any way to skip Finally block of exception occurs in the exception occurs in the exception block. Finally block is always executed when an exception occurs and the only
way to avoid execution of any statements in Finally block is by aborting the code forcibly by writing following line of code at the end of try block: System.exit(0); Q27. When the constructor of a class is invoked every time an object is created with new keyword. For example, in the following class two objects
are created using new keyword and hence, constructor is invoked two times. public class const example (); const example (); ystem.out.println("Inside constructors"); } Q28. Can a class have multiple constructors? Ans: Yes
a class can have multiple constructors with different parameters. Which constructor gets used for object creation depends on the arguments passed while creating the objects. Q29. Can we override static methods belong to a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods belong to a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods belong to a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods belong to a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static methods of a class? Ans: We cannot override static method override static methods of a class? An incomplex of a class override static method override static method override static meth
time of compilation (not at runtime). Even if we try to override static method, we will not get an complitaion error, nor the impact of overriding when running the code. Q30. In the below example, what will be the output? public class subclass
extends superclass { public void displayResult(); } super.displayResult(); } super.displayResult(); } public static void main(String args[]) { subclass Printing from subClass Printing from subClass Printing is not a primitive
data type in java. When a string is created in java, it's actually an object of Java. Lang. String class that gets created. After creation of this string object, all built-in methods of String s1="I am Java Expert"; String s2="I am C Expert"; String s2="I am C Expert"; String object, all built-in methods of String s1="I am Java Expert"; String s2="I am C Expert"; String object, all built-in methods of String s1="I am Java Expert"; String s2="I am C Expert"; String object, all built-in methods of String object, all built-in methods object, all built-in methods of String object, all built-in method
s3="I am Java Expert"; Ans: In the above example, two objects of Java.Lang.String class are created. s1 and s3 are references to same object is created. In
below example, reference str refers to a string object having value "Value one". String str="New Value"; Q34. What's the difference between an array and Vector? Ans: An array groups data of same primitive type and is
static in nature while vectors are dynamic in nature and can hold data of different data types. Q35. What is multi-threading? Ans: Multi threading? Ans: Multi threading is a programming concept to run multiple tasks in a concurrent manner within a single program.
program. Q36. Why Runnable Interface is used in Java? Ans: Runnable interface is used in java for implementing multi threaded applications. Java. Lang. Runnable interface is used in java? Ans: Multi threaded applications can be developed in
Java by using any of the following two methodologies: 1. By using Java. Lang. Runnable Interface which is implemented in data, which one should be a
preference to be used? String or StringBuffer? Ans: Since StringBuffer when data is being changed too much. If we use StringBuffer objects unlike String which is immutable, it's always a good choice to use StringBuffer when data is being changed too much. If we use String in such a case, for every data change a new String object will be
created which will be an extra overhead. Q39. What's the purpose of using Break in each case of Switch so that code breaks after the valid case and doesn't flow in the proceeding cases too. If break isn't used after each case, all cases after the valid case also get executed
resulting in wrong results. Q40. How garbage collection is done in Java? Ans: In java, when an object is not referenced any more, garbage collection takes place and the object is destroyed automatic garbage collection takes place and the object is destroyed automatic garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is destroyed automatic garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is destroyed automatic garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage collection takes place and the object is not referenced any more, garbage and the object is not referenced any more, garbage and the object is not referenced any more, garbage and the object is not referenced any more, garbage
method? Ans: If we want to execute any statements before even creation of objects at load time of class, we can use a static block of code in the class. Any statements inside this static block of code will get executed once at the time of loading the class and a sub-
class at the same time? Give example. Ans: If there is a hierarchy of inheritance used, a class can be a super class of country class and it's super class of country class of c
                                                                                                      ... } Q43. How objects of a class are created if no constructor is defined in the class? Ans: Even if no explicit constructor is defined in a java class, objects get created successfully as a default constructor is implicitly used for object creation. This constructor has no parameters. Q44. In
multi-threading how can we ensure that a resource synchronization. Using synchronization which are shared among multiple threads can be controlled by using the concept of synchronization. Using synchronization which are shared among multiple threads can be controlled by using the concept of synchronization.
others can get control of the resource only once it has become free from the other one using it. Q45. Can we call the constructor of a class more than once for an object at the time of object creation and hence, we can't invoke the
constructor again for an object after its creation. Q46. There are two classB and classB. Both classB are in the same package. Can a private member of classB are in the same package. Can a private member of classB are in the same package.
access them. Q47. Can we have two methods in a class with the same name? Ans: We can define two methods in a class with the same name but different
parameters. Depending upon the parameters, appropriate one will be called: public class methodExample { public void print() { system.out.println("Print method with parameters."); } public static void main(String args[]) { methodExample obj1 = new
methodExample(); obj1.print(); obj1.print();
copies. Q49. What's the benefit of using inheritance is reusability of code as inheritance enables sub-classes to reuse the code of its super class. Polymorphism (Extensibility of sub-classes to reuse the code of its super class. Polymorphism (Extensibility of sub-classes).
access specifier for variables and methods of a class? Ans: Default access specifier for variables and method is package protected i.e variables and class is available to any other class but in the same package, not outside the package protected i.e variables and methods of a class? Ans: There are no pointers in Java class. Ans: There are no pointers in Java class but in the same package, not outside the package protected i.e variables and method is package. Q51.
pointers in Java. Q52. How can we restrict inheritance for a class so that no class can be inherited from it? Ans: If we want a class not to be extended further by any class, we can use the keyword Final with the class name. In the following example, Stone ( // Class methods and Variables )
Q53. What's the access scope of Protected Access specifier? Ans: When a method or a variable is declared with Protected access specifier, it becomes accessible in the same class, any other class of the same package as well as a sub-class. Modifier Class Package Subclass World public Y Y Y N no modifier Y Y N N private Y N N N
Q54. What's difference between a stack and Queue is that stack in First out (LIFO) principle while a queue is based on FIFO (First In First Out) principle. Q55. In java, how we can disallow serialization of
variables? Ans: If we want certain variables of a class not to be serialized, we can use the keyword transient while declaring them. For example, the variable and can't be serialized private transient trans var; // rest of the code } Q56. How can we use primitive data types as transient trans var; // rest of the code } Q56. How can we use primitive data types as transient trans var; // rest of the code } Q56. How can we use primitive data types as transient trans var; // rest of the code } Q56. How can we use primitive data types as transient trans var; // rest of the code } Q56. How can we use primitive data types as transient variable and can't be serialized.
objects? Ans: Primitive data types like int can be handled as objects by the use of their respective wrapper classes. For example, Integer is a wrapper class for primitive data types of exceptions are caught at compile time? Ans: Checked exceptions can
be caught at the time of program compilation. Checked exceptions must be handled by using try catch block in the code in order to successfully compile the code. Q58. Describe different states of a thread in Java can be in either of the following states: Ready: When a thread is created, it's in Ready state. Running: A thread currently
being executed is in running state. Waiting: A thread waiting for another thread to free certain resources is in waiting state. Dead: A thread which has gone dead after execution is in dead state. Q59. Can we use a default constructor if no explicit
constructor is defined in a Java class. But if an explicit constructor has been defined, default constructor swhich are defined in the class. O60. Can we override a method by using same method name and arguments but different return types? Ans: The basic condition of method overriding
is that method name, arguments as well as return type doesn't override a method. Q61. What will be the output of following piece of code? public class operator example { public static void main(String args[]) { int x = 4; system.out.println(x++); } }
Ans: In this case postfix ++ operator is used which first returns the value and then increments. Hence it's output will be 4. Q61. A person says that he compiled a java class and is required for execution of the program however; a class
gets compiled successfully even if it doesn't have a main method. It can't be run though. Q62. Can we call a non-static method from inside a static method from a static method from a static method from a static method from a static method. It can't be run though. Q62. Can we call a non-static method from inside a static method from insi
class needs to be created first. Then using object reference, these methods can be invoked. Q63. What are the two environment variables that must be set in order to run any Java programs? Ans: Java programs
Q64. Can variables be used in Java without initialization? Ans: In Java, if a variable is used in a code without prior initialization by a valid value, program doesn't compile and gives an error as no default value is assigned to variables in Java be inherited from more than one class? Ans: In Java, a class can be derived from only
one class and not from multiple classes. Multiple inheritances is not supported by Java. Q66. Can a constructor have different, it doesn't act as a constructor and compiler thinks of it as a normal method. Q67. What will be the
output of Round(3.7) and Ceil(3.7)? Ans: Round(3.7) returns 4 and Ceil(3.7) returns 4. Q68: Can we use goto in Java to go to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line? Ans: In Java, there is not goto keyword and java doesn't support this feature of going to a particular line?
started again. There is no way to restart a dead thread. Q70. Is the following class declaration correct? Ans: public abstract final class testClass { // Class methods and variables } Ans: The above class declaration is incorrect as an abstract final class testClass { // Class methods and variables } Ans: The above class declaration is incorrect as an abstract final class testClass { // Class methods and variables } Ans: The above class declaration is incorrect as an abstract final class testClass { // Class methods and variables } Ans: The above class declaration is incorrect as an abstract final class testClass { // Class methods and variables } Ans: The above class declaration is incorrect as an abstract final class testClass { // Class methods and variables } Ans: The above class declaration is incorrect as an abstract final class testClass { // Class methods and variables } Ans: The above class declaration is incorrect as an abstract final class testClass final class testClass { // Class methods and variables } Ans: The above class declaration is incorrect as an abstract final class testClass final class fin
development Kit of Java and is required for development only and to run a Java program on a machine, JDK isn't required. Only JRE is required. Only JRE is required for development only and to run a Java program on a machine, JDK isn't required. Only JRE is required.
same value while == operator compares the references of two string objects. In the following example, equals() returns true as the two string objects have same values. However == operator returns false as both string objects have same values. However == operator compares the references of two string objects have same values.
String("Hello World"); String str2 = new String("Hello World"); if (str1 == str2) { //This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is NOT true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing same object"); } else { // This condition is true System.out.println("Both strings are referencing sam
are referencing different objects"); } } } Q73. Is it possible to define a method in Java class but provide it's implementation and then
implementation is done in another language like C separately. Q74. How are destructors defined in Java? Ans: In Java, there are no destructors defined in the class as there is no need to do so. Java has its own garbage collection mechanism which does the job automatically by destroying the objects when no longer referenced. Q75. Can a variable be
local and static at the same time? Ans: No a variable can't be static as well as local at the same time. Defining a local variable as static methods in an interface are by default abstract and are supposed to be
implemented in the classes being implementing an interface. So it makes no sense to have static methods in an interface in Java. Q77. In a class implementing an interface in the implementing class as all variables
defined in the interface are by default public, static and Final and final variables are like constants which can't be changed later. Q78. Is it correct to say that due to garbage collection is provided by Java, it doesn't ensure that a Java program
will not go out of memory as there is a possibility that creation of Java objects is being done at a faster pace compared to garbage collection helps in reducing the chances of a program going out of memory but it doesn't ensure that. Q79. Can we have any other return
type than void for main method? Ans: No, Java class main method can have only void return type for the program to get successfully executed. Nonetheless, if you absolutely must return a value to at the completion of main method? Ans: No, Java class main method? Ans: No, Java class main method can have only void return type for the program to get successfully executed. Nonetheless, if you absolutely must return a value to at the completion of main method? Ans: No, Java class main method? Ans
it's possible? Ans: Once an object has been destroyed by garbage collector, it no longer exists on the heap and it can't be accessed again. There is no way to reference it again. Q81. In Java thread programming, which method is a must implemented by all
threads, Q82. I want to control database connections in my program and want that only one thread should be able to make database connection at a time. How can I implement this logic? Ans: This can be implemented by use of the concept of synchronization. Database connections in my program and want that only one thread should be able to make database connection at a time.
only one thread can access it at a time. Q83. How can an exception be thrown manually by a programmer? Ans: In order to throw an exception in a block of code manually, throw keyword is used. Then this exception is caught and handled in the catch block. public void
excMethod { String name = null; if (name == null) { throw (new ManualException ("Exception thrown manually "); } } Q84. I want my class to be developed in such a way that no other class (even derived class) can create its objects. How can I do so? Ans: If we declare the constructor of a class as private, it will not be accessible by any other class
and hence, no other class will be able to instantiate it and formation of its object will be limited to itself only. Q85. How objects are stored in Java? Ans: In java, each object when created gets a memory space from a heap. When an object is destroyed by a garbage collector, the space allocated to it from the heap is re-allocated to the heap and becomes
available for any new objects. Q86. How can we find the actual size of an object on the heap? Ans: In java, there is no way to find out the exact size of an object Ans: Three methods, four variables, no object Class B: Five methods, three variables, no object Ans:
Memory isn't allocated before creation of objects. Since for both classes, there are no objects created so no memory is allocated on heap for any class. Q88. What happens if an exception is not handled in a program gets aborted and no statement executes after the
statement which caused exception throwing. Q89. I have multiple constructor's body? Ans: If a class, as multiple constructors, it's possible to call one constructor from another one using this(). Q90. What's meant by anonymous class? Ans: An anonymous class
is a class defined without any name in a single line of code using new keyword. For example, in below code we have defined an anonymous class in one line of code: public java.util.Enumeration () { @Override public boolean hasMoreElements() { // TODO Auto-generated method stub return false; }
@Override public Object nextElement() { // TODO Auto-generated method stub return null; } } Q91. Is there a way to increase the size of an array after its declaration? Ans: Arrays are static and once we have specified its size, we can't change it. If we want to use such collections where we may require a change of size (no of items), we should prefer
vector over array. Q92. If an application has multiple classes in it, is it okay to have a main method in more than one class? Ans: If there is main method in more than one classes in a java application will be a specific class and code will start from the main method of that particular class only.
Q93. I want to persist data of objects for later use. What's the best approach to do so? Ans: The best way to persist data for future use is to use the concept of serialization. Q94. What is a Local class in Java? Ans: In Java, if we define a new class inside a particular block, it's called a local class. Such a class has local scope and isn't usable outside the
block where its defined. Q95. String and StringBuffer both represent String objects, we can't compare them with each other and if we try to compare them, we get an error. Q96. Which API is provided by Java for operations on set of
objects? Ans: Java provides a Collection API which provides and TreeMap, TreeSet and TreeMap,
type to Boolean data type nor can cast Boolean data type to any other primitive data type. Q98. Can we use different return types for method should have same name, and parameters. But a method can be overridden with a different return type
as long as the new return type extends the original. For example, method } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type. Class B extends A { A method(int x) { //original method } } Returning a reference type a returning a reference type a returning a returning a reference type a returning a retu
classes are derived from this base class. Q100. What's the order of call of constructor of the derived class is invoked. Prep Up For your Job Interview!!! Go through Java Tutorial to be
better prepared. This detailed Java interview questions pdf will help you to clear the doubts about Java interview questions and will also help you to crack the interview. Free PDF Download: Java Interview Interview Questions & Answers
